

# PROGRAMMABLE MONEY

## Radar Agent

Agents buy market signals in USDC, then act through a hard safety layer.

AGENTIC ECONOMY · ARC TESTNET

ENCE

ts pay for signal,  
act with **discipline**

ETH and BTC price movement into an x402-  
onomous buyer pays in USDC, evaluates an  
n rebalance a treasury through Circle App Kit.

symbol=ETH-USD

**\$0.001 USDC**

# Agents need a payment rail—and custody boundaries.

## THE GAP

Calling an API is easy. Letting an agent spend and move money is not.

A useful autonomous agent needs per-request payment, an explainable decision boundary, and controls that cannot be talked around.

- ④ Pay per signal
- ④ Explain every decision
- ④ Cap every spend
- ④ Prevent replay
- ④ Trace settlement

# One closed loop turns information into bounded action.

01 · SELL

x402 signal API  
Recent ETH/BTC  
movement becomes a  
\$0.001 USDC signal.

02 · BUY

Explainable agent  
Pay, evaluate the  
threshold rule, then  
authorize or hold.

03 · SETTLE

Circle execution  
App Kit moves capped  
USDC between active  
and reserve wallets.

# The discipline layer—not the model—controls custody.

## Spending caps

Separate daily limits for signal purchases and treasury moves.

## Replay safety

Deterministic idempotency keys stop duplicate execution.

## Position safety

A reconciled balance and minimum reserve are mandatory.

## Breaker + audit

Three failures halt the agent; every step remains traceable.

# The MVP is implemented, tested, and funded on testnet.

## WORKING PROOF

A real paid signal triggered a real guarded treasury rebalance on Arc Testnet.

\$0.001

per x402 signal

1 USDC

treasury transfer

5 / 5

automated tests  
pass

Real execution, not a mock.

A **-180 bps signal at 0.94 confidence** passed every guard.

x402 payment succeeded. Circle App Kit then moved 1 USDC from the active wallet to reserve. The transaction is public on ArcScan.
